Fresh air
in your house!
TwinFresh Expert is a new series of single-room energy recovery ventilators

TwinFresh Expert is the most state-of-the-art and efficient solution for a comfortable indoor climate and required air exchange in renovated premises, brand new recently inhabited houses or reconstructed apartments.

TwinFresh Expert RA1-50-2 features

- Communication between several ventilators for coordinated operation.
- Efficient supply and exhaust single-room ventilation up to 29 CFM.
- High-tech ceramic energy regenerator with max. heat recovery efficiency up to 93%.
- Reversible DC motors with low energy demand from 3.61 W and safe voltage of 12 V.
- Integrated humidity sensor or connection to external sensor for comfortable microclimate.
- Integrated control system.
- Silent operation from 0.3 Sones.
- Easy mounting and maintenance.
- Air cleaning with total MERV 5 class filters (optionally MERV 14 filter).
- Rated for continuous operation.
- Frost- and condensate-free.

Ceramic energy regenerator

The high-tech ceramic regenerator with heat recovery efficiency up to 93% is used for heating of supply air by means of the exhaust air heat recovery. Due to its honeycomb structure, the unique heat exchanger has larger air contact area and excellent heat conducting and accumulating properties. The ceramic regenerator has a special anti-bacterial treatment to prevent bacteria generation inside of it. The antibacterial treatment is rated for 10 year operation.

One of the best heat recovery efficiency on the market due to innovative hexagonal structure of the heat exchanger cells.

Decorative front panel

The specially designed front panel can be closed manually to ensure 100% air tightness and protection against wind.

Easy maintenance. The indoor unit is opened by pressing the latches on both sides.

Integrated air shutters prevent air back drafting.
**Reversible DC motor**

Air is supplied or exhausted by a reversible axial fan with DC motor. Due to DC technology the fan has outstanding low energy demand. The fan is powered by safe voltage 12 V. The motor has integrated overheating protection and ball bearings for long service life.

**Air filters**

The two integrated air filters with total filtration rate MERV 5 provide supply and exhaust air filtration. The filters prevent ingress of dust and insects into the supply air and contamination of the ventilator parts. The filters also have antibacterial treatment. The filter cleaning is done with a vacuum cleaner or water flushing. The antibacterial properties is not removed. MERV 14 filter with the filtration class PM2.5 99 % is available as a specially ordered accessory.*

* Reduces the air flow down to 24 CFM when installed.
**TwinFresh ventilator functioning**

The ventilator is designed both for reversible mode with energy regeneration and supply or exhaust mode with no regeneration.

- **CYCLE I.** Warm stale air is exhausted from the premise, flows through the ceramic regenerator and transfers up to 93% of the accumulated heat and moisture to it. As the ceramic regenerator gets warmed up, the ventilator switches to the supply mode.

- **CYCLE II.** Clean cold intake air flows through the regenerator and absorbs accumulated heat and humidity. In 70 seconds, after cooling of the ceramic regenerator, the ventilator is switched to the exhaust air mode and a new cycle starts.

**Control**

The ventilator is controlled by means of:

- **control panel**
  - Speed selection and OFF button
  - Energy recovery mode
  - Ventilation mode
  - Filter
  - Alarm
  - Master

- **remote control**
  - ON/OFF button
  - 3 unit speeds
  - Ventilation mode
  - Heat recovery mode
  - Night timer: Low speed for 8 hours
  - Party: High speed for 4 hours

**Connection of several ventilators for synchronous operation**

master  slave  slave  slave
Mounting

The ventilator is designed for through-the-wall installation inside a prepared hole in an outer wall of the building.

The best ventilation solution is pairwise installation of reverse phase connected ventilators when some units ensure supply of fresh air to the room and the other units exhaust air from the premise. This way the most efficient balanced ventilation is arranged.

In case of brand new construction, the ventilators are mounted in two stages:

1. Pre-installation at the stage of the indoor finishing and outer decorative wall finishing. It includes installation of an air duct, an outer ventilation hood and cable installation.
2. Final mounting before commissioning of a house. It includes installation of a regenerator with a fan and filters and mounting and wiring of an indoor unit with a controller and shutters.
